

### Client Information

<i>Client Name</i>	Demo Client
<i>Date of birth (age)</i>	01 January 1990 (31)

### Assessment Information

<i>Assessment</i>	Autism Spectrum Quotient (AQ)
<i>Date administered</i>	31 October 2021
<i>Assessor</i>	Mr Demo Account
<i>Time taken</i>	4 minutes 49 seconds

### Results

	Raw Score	Autism Percentile	Community Percentile
Total Score (0 - 50)	14	0.1	28.8
Communication (0 - 10)	1	0.1	18.4
Social Skills (0 - 10)	3	1.4	53.2
Imagination (0 - 10)	2	2.8	35.6
Attention to Details (0 - 10)	5	24.3	46.5
Attention Switching (0 - 10)	3	0.7	24.7

### Interpretive Text

This individual scored below 29, indicating their responses are not indicative of someone with autism.

**Percentile Compared to Autism Sample**

### Scoring and Interpretation Information

Items are summed to obtain an overall total score and scores for each of the five subscales. Higher scores indicate responses that are more consistent with autism traits.

A total score of 29 or more is indicative of clinically significant autism traits (Broadbent, et al., 2013). Using the cut-off score of 29 has a false positive rate of 1%, however will fail to identify 14.4% of people who actually do meet the diagnostic criteria for DSM-5 defined Autism Spectrum Disorder.

The total score and subscale scores are also represented as percentiles for comparison to gender specific norms for the Autism Sample and the Community Sample (Baron-Cohen et al., 2001).

Percentiles compared to the Autism Sample compares the respondent's score to people who have been diagnosed with Autism, where a percentile of 50 indicates typical scores for someone with Autism.

For men, a total score of 29 corresponds to a percentile compared to the male autism sample of 18.9 and a percentile of 95 compared to the male community sample.

For women, a total score of 29 corresponds to a percentile compared to the female autism sample of 1.9 and a percentile of 99.1 compared to the female community sample.

Five subscales are presented, with higher scores on each subscale indicate more neurodivergence in each area. For example, high scores on social skills indicates more social skills deficits, and high scores on attention to detail indicates an atypical focus on details. The following items are summed to obtain scores for each of the subscales:

- Social skill: items 1,11,13,15,22,36,44,45, 47,48
- Attention switching: items 2,4,10,16,25,32,34, 37,43,46
- Attention to detail: items 5,6,9,12,19,23,28, 29,30,49
- Communication: items 7,17,18,26,27,31,33, 35,38,39
- Imagination items: 3,8,14,20,21,24,40,41,42,50

### Client Responses

		Definitely Agree	Slightly Agree	Slightly Disagree	Definitely Disagree
1	I prefer to do things with others rather than on my own	0	0	1	1
2	I prefer to do things the same way over and over again	1	1	0	0
